

ASMGi ONEteam

Build secure, high-quality software faster

By integrating and automating security checks throughout the SDLC, development teams streamline development while improving security.

Maximize the effectiveness of application security programs

When security teams work with development to shift security testing earlier in development, costs and effort go down, and compliance rates go up.

Ensure production applications and containers

Operations teams can avoid being blindsided by application vulnerabilities in production when they have insight into the components used in the applications and supporting infrastructure.

Release Secure, Quality Code Faster - ASMGi helps you build security into DevOps

DevOps culture and practices help your organization rapidly build, reliably operate, and continuously improve your software solutions. However, DevOps can break your traditional application security testing processes and tools.

To maintain velocity without compromising security, you need to integrate security at every stage. **That's DevSecOps!**

DevOps isn't just about tools. It's about people, processes, and technologies coming together to deliver better software efficiently. DevSecOps is being driven by the priorities of software quality and security, compliance requirements and avoiding risk.

ASMGi helps you integrate security end to end.

Professional Services

ASMGi Experts help you chart a successful course to DevSecOps

- Secure Development Programs & Training
- CI/CD Strategy & Planning
- Cloud Security Assessments

Integrated Tools

Integrate and automate application security into your SW Dev pipeline

- Static Application Security Testing (SAST)
- Software Composition Analysis (SCA)

Managed Services

Optimize your resource use with on-demand security testing such as.

- Managed DAST
- Managed Pen Testing
- Managed SAST

DevSecOps Is A Team Effort
